Abstract

This package defines a `\makebox*` command that allows to give the width for the `\makebox` command by a sample text instead of a measure.

1 Using this package

Sometimes you want to put a text into a box that has the same width as another text. Normally, you have to use `\settowidth` to set a length to the width of the reference text and use `\makebox` afterwards. With this package, you can use the `\makebox*` command for that. The width of the box is then given by a mandatory first argument (instead of the optional first argument of the `\makebox` command). The following arguments are identically to the normal `\makebox` command.

For example,

```
--longer reference text--\*  
--\makebox*{longer reference text}{short text}--\*  
--\makebox*{longer reference text}[r]{short text}--\*  
--\makebox*{longer reference text}[r]{even longer text than the reference}--
```

*This file has version v0.1 last revised 2004/07/31.

leads to
 -longer reference text-
 - short text -
 - short text-
 even longer text than the reference

2 The implementation

Heading of the package:

```
1 \NeedsTeXFormat{LaTeX2e}
2 \ProvidesPackage{makebox}
3 [2004/07/31 v0.1 extend makebox command]
```

`\makebox*` Save the original `\makebox` command since it has to be redefined.

```
4 \newcommand*\hh@orig@makebox{}
5 \let\hh@orig@makebox\makebox
```

Redefine `\makebox`. If using normally call the original command. If using with a star, get the width of the box by a text and call `\hh@makebox` for doing so.

```
6 \renewcommand*\makebox{%
7 \ifnextchar*%
8 {\hh@makebox}{\hh@orig@makebox}%
9 }
```

The `\hh@makebox` is defined with two mandatory arguments since the star is the first argument and ignored. First, the width of the reference text is stored in the length `\@tempdima`. Then, the original `\makebox` command is called to typeset the box.

```
10 \newcommand*\hh@makebox[2]{%
11 \settowidth\@tempdima{#2}%
12 \hh@orig@makebox[\@tempdima]%
13 }
```
