

## 0.1 ternaryplot: Ternary diagram

### Description

Visualizes compositional, 3-dimensional data in an equilateral triangle (from the vcd library, Version 0.1-3.3, Date 2004-04-21), using plot graphics. Differs from implementation in vcd (0.9-7), which uses grid graphics.

### Usage

```
ternaryplot(x, scale = 1, dimnames = NULL, dimnames.position = c("corner", "edge", "none"),
            dimnames.color = "black", id = NULL, id.color = "black", coordinates = FALSE,
            grid = TRUE, grid.color = "gray", labels = c("inside", "outside", "none"),
            labels.color = "darkgray", border = "black", bg = "white", pch = 19, cex =
            prop.size = FALSE, col = "red", main = "ternary plot", ...)
```

### Arguments

<b>x</b>	a matrix with three columns.
<b>scale</b>	row sums scale to be used.
<b>dimnames</b>	dimension labels (defaults to the column names of <b>x</b> ).
<b>dimnames.position, dimnames.color</b>	position and color of dimension labels.
<b>id</b>	optional labels to be plotted below the plot symbols. <b>coordinates</b> and <b>id</b> are mutual exclusive.
<b>id.color</b>	color of these labels.
<b>coordinates</b>	if TRUE, the coordinates of the points are plotted below them. <b>coordinates</b> and <b>id</b> are mutual exclusive.
<b>grid</b>	if TRUE, a grid is plotted. May optionally be a string indicating the line type (default: "dotted").
<b>grid.color</b>	grid color.
<b>labels, labels.color</b>	position and color of the grid labels.
<b>border</b>	color of the triangle border.
<b>bg</b>	triangle background.
<b>pch</b>	plotting character. Defaults to filled dots.
<b>cex</b>	a numerical value giving the amount by which plotting text and symbols should be scaled relative to the default. Ignored for the symbol size if <b>prop.size</b> is not FALSE.

**prop.size** if TRUE, the symbol size is plotted proportional to the row sum of the three variables, i.e. represents the weight of the observation.  
**col** plotting color.  
**main** main title.  
**...** additional graphics parameters (see **par**)

## Details

A points' coordinates are found by computing the gravity center of mass points using the data entries as weights. Thus, the coordinates of a point  $P(a,b,c)$ ,  $a + b + c = 1$ , are:  $P(b + c/2, c * \sqrt{3}/2)$ .

## Examples

```

data(mexico)
if (require(VGAM)) {
  z.out <- zelig(as.factor(vote88) ~ pristr + othcok + othsocok,
                 model = "mlogit", data = mexico)
  x.out <- setx(z.out)
  s.out <- sim(z.out, x = x.out)

  ternaryplot(s.out$qi$ev, pch = ".", col = "blue",
              main = "1988 Mexican Presidential Election")
}

```
